The 78th Report on
FOOD FROM CONNECTICUT MARKETS AND FARMS
1973

J. Gordon Hanna, Chief Chemist

The Station has published annual bulletins since 1896, showing the examination results for food purchased on the open market in Connecticut. The data are publicized to deter fraud and deception by dealers and producers and to provide consumers with information that will help them select the most reliable brands and suppliers.

The Commissioners of the State Department of Consumer Protection and of the State Department of Agriculture are vested with the statutory authority for the collection of samples and prosecution of violators. Only official samples submitted by inspectors under the directions of these Commissioners are included in this report. The analytical results have been reported to the Commissioners as soon as they were obtained, to aid them in enforcement. This Station has no authority to prosecute violators.

Many of the listed food samples were collected because they were already suspect, either by inspectors or by consumers, and random sampling is not implied. Therefore, the ratio of the number of samples deficient to the total number examined is probably higher than it would be if the sampling had been random.

Not included in the tabulation are 50 samples of milk submitted for vitamin D assay and 390 samples of milk submitted for chlorinated pesticide residue analyses. All the vitamin D milk samples conformed to the 400 USP units of vitamin D per quart requirement. None of the milk samples contained residues in excess of the established tolerances.

Analysis for adulteration or for conformance to label claims was the basis for judging acceptability of many samples. In other cases, Connecticut and Federal definitions and standards of identity were used. Some of the latter requirements, which normally do not prescribe label declarations of the ingredients, may be helpful in interpreting the data given.

Frankfurters and bologna are limited to 30 percent fat, 3.5 percent fillers (such as cereal, starch, soy products and nonfat dry milk), 10 percent added water, and 200 parts per million nitrite. Hamburg must not

contain more than 30 percent fat, and pork sausage not more than 50 percent fat. The addition of sulfur dioxide to any meat product is illegal. Egg noodles must contain at least 5.5 percent solids of egg or egg yolk.

A new law in Connecticut requires that all flour, bread, corn meal, grits, and rice must be enriched by Federal standards. For example, flour must contain 2.0 to 2.5 milligrams thiamin per pound, 1.2 to 1.5 milligrams riboflavin per pound, 16 to 20 milligrams niacin per pound and 13.0 to 16.5 milligrams iron per pound.

The significance of traces of pesticide residues in milk and other foods is evaluated by comparison with official tolerance levels established and reviewed periodically by the U. S. Department of Health, Education and Welfare. The established tolerance levels include at least a 100-fold safety factor, determined by physiological effects of each pesticide on test animals.

Organoleptic tests made on some samples involve the use of sense organs. These tests, normally conducted by a panel of three or more people, evaluate the odor, taste and appearance of the food.

The analytical work represented by this report was performed by R. Barger, R. G. Botsford, S. Christie, W. Glowa, L. Hankin, J. J. Hayes, L. G. Hornig, L. G. Keirstead, L. A. McLean, G. Smith, S. R. Squires and A. Wickroski. Clerical work and reporting were by B. Lindgren. The bulletin was typed by C. M. Peet.

Following are the meanings of abbreviations used in the report:

MSG,	monosodium glutamate
NFDM,	nonfat dry milk
PPM,	parts per million
P-OK,	pesticide residues within tolerances
T-OK,	organoleptic tests, satisfactory
